

# Country Profiles → dedicated dashboard tab & Visualize data from all years, not separately

- **Country Profiles** are perfect candidates to build a dashboard around, on a different/2nd tab
  - e.g. “Which direction is my country X is going regarding personal / economic freedoms?” → **could be much easier to answer**
  - in its current form in order to see how the situation evolved in US, one has to download the country profiles pdf file, and scroll all the way down & it only shows the combined h.f. index
- The resource has data from 5 years & will continue to grow:
  - **Maybe, instead of listing the all the data by year, we can merge them into 1 visualization**
  - By default, **show the most recent data** & let the user choose the year for earlier years
  - Include worldwide/region-wide trend charts over the years in the main dashboard
  - Include country trend charts over the years in the country profiles section
    - e.g. how did p.f. **(not just the combined index)** in country X evolve over the past 5 years

# Additional Analysis Plots & Visualization Exports can help popularize the resource

- In addition to existing plots, we can include additional analysis:
  - We can introduce **country/region comparisons** visualizations
  - We can allow the user to visualize **finer grained data**, that make up individual indices
  - We achieve all of this in a way that the dashboard is not cluttered, and hides away plots that are not requested
- We can allow the user download static exports from both the home & country profile tabs
